Title:

(us-09-695-451-1)

Perfect score:

2161

Sequence:

1 cygcccayrgatcttgaacc.....tacactaaaattctgaagtt 2161

Scoring table: IDENTITY NUC

ng table: IDENTITY\_NUC Gapop 10.0 , Gapext 0.5 Searched: 1664 seqs, 26385 residues Total number of hits satisfying chosen parameters:

3328

or many of the sacistying chosen para nimim DR sed length. 8

Minimum DB seq length: 8
Maximum DB seq length: 80
Post-processing: Minimum Match 0%
Maximum Match 100%
Listing first 1745 summaries

Database : rng.seq:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

·,
                                                                               The present invention relates to polymorphic variants of the tumour necrosis factor receptor 1 (TNFR1) gene. The sequence of the gene is given in AAA95102, AAA95103 and AAA95104. The polymorphisms were polymorphic loci waplifying and sequencing regions of the gene. Twelve polymorphic loci were discovered. Of these twelve polymorphisms, four causes a change in the TNFR1 protein. The present sequence is a primer used to amplify part of the TNFR1 gene. The TNFR1 polymorphisms may be useful for studying the biological function of TNFR1 as well as for identifying target targething the protein for treatment of disorders related to its abnormal expression or function such as tumours, apoptosis related disorders and bacterial infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes novel homogeneous insoluble proteins (I), their (in) soluble fragments (Ia) and their salts that can bind tumour necrosis factor (INF). The products of the invention have anti-inflammatory and

antimalarial activity. (I) and (Ia) are used (i) to treat diseases in which TMF is involved (e.g. septic shock, autoimmus glomerulonephritis, cerebral malaria, immune responses and inflammation), (ii) to purify TMF, (iii) to identify TMF (ant) agonists and (iv) for diagnostic determination of TMF in body fluids. Antibodies raised against (I) are used for affinity purification of (I). This sequence represents a PCR primer used in the amplification of the TMF binding protein of the invention. (Updated on 20-MAR-2003 to correct PF field.) (Updated on 20-MAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes novel insoluble proteins (I), also their (in) soluble fragments and pharmaceutically acceptable salts, able to bind tumor necrosis factor (TNF) and in homogeneous form. The products of the invention have antiinflammatory, immunosuppressive, antibacterial, antiprotozoal activity. (I), and related recombinant proteins, are used to treat diseases mediated by TNF, e.g. shock in cases of meningococal sepsis; development of autoimmune glomerulonephritis and cerebral sepsis; development of autoimmune glomerulonephritis and cerebral diagnostic determination of TNF in body fluids, for affinity purification of TNF and for identifying (ant) agonists of TNF. This sequence represents a PCR primer used in the amplification of the human 55 kD TNFPP described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TNF; tumor necrosis factor binding protein; TNFBP; treatment; insoluble protein; antinflammatory; immunosuppressive; antibacterial; antiprotozoal; treatment; meningococcal sepsis; cerebral malaria; autoimmune glomerulonephritis; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  homogeneous, insoluble proteins that bind tumor necrosis factor F), useful for treating TNF-mediated disorders, e.g. inflammation

(UYST-) UNIV STUTTGART PFIZENMAIER K.

(PFIZ/)

New polypeptide prodrug, useful e.g. for treating tumors, c targeting region, active agent and attached inhibitor that proteolytically cleaved in target cells.

```
The present invention relates to plasmic change agents with cell differentiation activity containing protein Tis. These can be used in the treatment, prevention and diagnosis of rhabdosarcoma, leiomyosarcoma, muscular dystrophy and uterine myeloma. The present sequence is a PCR primer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Prodrug, TNF, tumour necrosis factor; selectokine; chimeric; W24; W33; cytostatic; immunomodulatory; antianglogenic; apoptosis inducer; gene therapy; scFv antibody OS4; fibroblast activation protein; tenascin; solid tumour; anglogenesis; treatment; infection; metabolic disease; PCR;

This invention describes a novel polypeptide (I) comprising, in the N to C direction, a region (R1) that recognises selectively a specific c direction, a region (R2) with biological activity for a exacronolecule on a cell surface and/or a component of the extracellular matrix, peptide linker, a region (R3) with biological activity for a specific target molecule, a region (R3) with biological activity for a specific target molecule, a region (R3) that has a processing site and a cegion (R4) that inhibits the activity of R2, by intramolecular bonding and/or interaction. The products of the invention have cytostatic, and/or interaction. The products of the invention have expostatic, immunomodulatory and antiangiogenic activity, induce apoptosis and can be product W24, containing, essentially, the single-chain Fv antibody OS4, specific for human fibroblast activation protein, trimerization linker, specific for human fibroblast activation protein, trimerization linker, specific for human fibroblast activation protein, trimerization with a proteolytic cleavage site, and human TNP receptor.

C region with a proteolytic cleavage site, and human TNP receptor.

C fragment, and with trypsin (activator) for E minutes. After 16 hours, cell viability was determined by MTT staining. Activated M24 had LD50 about 0.5 mg/m1, comparable W14. (I), also mucleic acids encoding them and related vectors, are useful particularly for treating solid tumours and metabolic diseases. (I) are producy forms of 2 that have companied by conceptable toxicity when administered systemically (specifically with referention of, or even increase in, therapeutic activity, R2 is released only in target tissue, resulting in a high local concentration, and activity is potentiated by co-activation of the buman TNFRI fragment cused in the disclosure of the invention of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        o;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Fusion protein; stabilising polypeptide; proteolytic degradation; resistance; half-life; autoimmune disease; inflammation; nitro drug; lkappab regulator protein; inflammatory bowel disease; in vivo imaging; nitroreductase protein; enzyme therapy; produg therapy; protease; cancer; pathological condition; minimal motif; PCR primer; ss.

```
The invention relates to an isolated DNA molecule which encodes a polypeptide capable of binding to an intracellular domain of a p55 tumounecrotic factor (TNF) receptor. The DNA molecule is useful for preparing a composition for treating tumour, rheumatoid arthritis or inflammatory diseases. The invention is useful in gene therapy. The present sequence is a PCR primer used in the construction of soluble dimeric TNF receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 resistance; haif-life; autoimmune disease; inflammation; nitro drug; lkappal regularor protein; inflammatory bowel disease; in vivo imaging; nitroreductase protein; enzyme therapy; prodrug therapy; protease; cancer; pathological condition; minimal motif; PCR primer; ss.
                                                                                                                                                                                                                                                                  New DNA molecule encoding a polypeptide capable of binding to an intracellular domain of a p55 tumor necrotic factor (TNF) receptor, useful for preparing a composition for treating tumor, rheumatoid arthritis or inflammatory diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            protein; stabilising polypeptide; proteolytic degradation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ₹
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequences shown in AAV55812 to AAV55827 represent primers used in the course of the invention for the multimerisation of minimal motifs. The invention for the multimerisation of minimal motifs. The invention provides a method for increasing the resistance of a core protein to protectly the degradation that comprises linking or inserting onto or into the core protein a stabilising polypeptide of formula [(Glya)X(Glyb)X(Glyb)X) where Glya, Glyb, Glyc are 1-6 sequential Gly residues and X, Y, Z are Ala, Ser, Yal, II-e, Leu, Met, Phe, Pro or Thr and n can be anything between 1-66. X, Y and Z need not be identical from n repeat to n repeat Alternatively a nucleic acid encoding a stabilising polypeptide can be linked onto or inserted into a nucleic acid encoding to protein. The fusion proteins of the invention are more resistant to degradation by proteases and, thus, have a longer half-life than the unfused core protein. The products can be used for treating autoimmune at IsappaB regulator protein for the treatment of inflammatory bowel and inflammation. In particular, the core protein may be an IkappaB regulator protein for the treatment of inflammatory bowel disease, or a nitroreductase protein which can activate nitro drugs in enzyme/protein glarance cancer or other pathological conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

Sequences shown in AAV55812 to AAV55827 represent primers used in the course of the invention for the multimerisation of minimal motifs. The invention provides a method for increasing the resistence of a core protein to provides a method for increasing the resistence of a core protein to proteolytic degradation that comprises linking or inserting onto or into the core protein a stabilising polypeptide of formula ([Glya7] K(Glyo7]) where Glya, Glyb, Glyc are 1-6 sequential Gly residues and X, Y, Z are Ala, Ser, Val, IIe, Leu, Met, Phe, Pro or Thr and n can be anything between 1-66. X, Y and Z need not be identical from n repeat to n repeat. Alternatively a nucleic acid encoding a stabilising polypeptide can be linked onto or inserted into a nucleic acid encoding a core protein. The fusion proteins of the invention are more resistant to degradation by proteases and, thus, have a longer half-life than the unfused core protein. The products can be used for treating autoimmune diseases, cancer and inflammation. In particular, the core protein may be a IkappaB regulator protein for the treatment of inflammatory bowel diseases, can a nitroreductase protein which can activate nitro drugs in the functional proteins can also be used in diagnostic methods such as in a stabilising polypeptide comprising a peptide sequence vivo imaging. (Updated on 27-AUG-2003 to correct OS field.) 72; 120pp; English core protein with a stablin containing glycine repeats. Disclosure; Page

Expressing and isolating recombinant protein in a plant, useful for producing large quantities of recombinant proteins, by expressing a fusion protein including a cellulose binding peptide fused to a recombinant protein.

Example; Page 48; 87pp; English.

```
The specification describes a method for expressing and isolating a recombinant protein in a plant. The method comprising expressing a fusion protein including the recombinant protein and a cellulose binding peptide fused to it, where the fusion protein is compartmentalised and sequestered within plant cells, plant derived tissue or cultured plant cells. The method is useful for obtaining large quantities of the recombinant proteins and protein products in a simple and cost-effective manner. Recombinant proteins may be used commercially, such as in the code processing industry, e.g. glucoamylases and glucos isomerzaes are used for converting starch to high fructose corn syrup, proteinases for the hydrolysis of high molecular weight proteins and in manufacturing leather or alcoholic beverages, pectineserses for pectin hydrolysis in food industry, lipases for cleaving ester linkage in triglycenties, and code industry, lipases for cleaving ester linkage in triglycenties, and produce protein antibiotics, which can be used in healing processes, and to produce animal feed enzymes. PCR primers AAF24736-37 were used to amplify DNA encoding a CBD-fma peptide. The amplified fragment was used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       to produce the fusion proteins of the invention

Blais Y, Rousseau P,

A Cell-TRAP method, useful for producing or validating therapeutic compounds, by employing a recombinant cell-based library that carry constructs driven by a minimal promoter and a transcription factorresponsive element.

Disclosure; Page 24; 44pp; English.

This invention relates to a cell-TRAP method for selecting and producing a therapeutic compound which is presumed selective for, one or a restricted set of given transcriptional pathways and cell types by employing a recombinant cell-based library that carries a construct comprising a reporter gene driven by a minimal promoter and a transcription factor-responsive element (FRRD). The invention also comprises a method for validating a putative compound as a selective therapeutic compound towards a transcription factor response element. The

```
method of the invention is useful for determining the transcriptional activation pathways used by any compound that is biologically active in a cell. This method allows a global view of gene transcription activation in response to diverse stimuli in multiple environments and is a significant improvement over case-by-case approaches, which would be limited to certain aspects of gene activation. It permits to save on clinical trials by screening properly the compounds that would have a lesser probability of providing undesirable, even severe side effects. The present sequence represents a double stranded oligonucleotide probe recognised by a specific transcription factor which is used in the method
                                                                                                                                                                                                                                                                              .

The sequences given in AAG61825-50 and AAG61886-906 are oligonucleotides which contain a G4 or two G3 stretches and which may be used for inhibiting replication of herpes simplex virus (HSV). Oligonucleotides such as these may also be used for inhibiting activity of HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyperproliferation, malignancy, cardiovascular disease and snake bite. They may also be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New modified oligo-nucleotide contg guanine quartet - inhibits activity of viruses, e.g. HIV, and phospholipase A2 and modulates telomere length
neurological disorders caused by phospholipase A2 activity in cases of hyperproliferation, malignancy, cardiovascular disease and snake bite. They may also be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)

New peptide mucleic acid (PNA) oligomers are provided which (a) consist of naturally occurring nucleobases covalently bound to a polyamide backbone and (b) hybridise to the translation initiation AUG region, 5' untranslated region (5' UTR), 3' untranslated region (3' UTR), splice junctions or coding sequence of a human immunodeficiency virus gene chosen from env. gag, pol, rev and tat. The PNAs can be used to target RNA and single stranded DNA (ssDNA) to produce antisense-type gene regulation moieties. They have utility as gene-targetted drugs for regulation moieties. They have utility as gene-targetted drugs for modulating HIV processes. Hence they can be used to treat AIDS and other viral infections. They are also useful in diagnostic applications and as research tools. PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which a first PNA strand binds with the first PNA strand binds with the first PNA strand. The PNAs possess no significant charge and are water soluble, which facilitates cellular

This sequence represents a primer used in the construction of a chimeric antibody used in the method of the invention. The method of the invention is for treating rheumatoid arthritis in a human, and comprises administering rheumatoid arthritis in a human, and comprises a comprise a non-human variable region or a TWF antiper. TWF chimeric antibody (Ab), where the antiphidibiting amount of an anti-TWF chimeric antibody (Ab), where the antiphiding portion of the variable region or a TWF antipgen binding portion of the variable region, and a human constant region. The method can be used for in vitro, in situ and/or in vivo diagnosis and/or treatment of animal cells, tissues or pathologies associated with the presence of TWF The Abs used in the method can also be used for removing TWF from a solution or cells, inhibiting one or more biological activities of TWF in vitro, in situ or in vitro. Such removal can include treatment methods of the invention for alleviating symptoms or pathologies involving TWF, such as bacterial, viral or parasitic inflammatory diseases, autoimmune diseases,
                                                                                                                                  anti-TNF chimeric antibody, inhibitor, therapy, diagnosis, infection, chronic inflammatory disease, autoimmune disease, light chain, amplify, neurodegenerative disease, variable region, PCR primer, ss.

Treatment of tumor necrosis factor-alpha mediated disease using chimeric antibodies.

Vilcek J;

Seigal S,

Example 24; Col 84; 90pp; English.

mediated diseases such as immune and autointumune pathologies e.g.

rheumatoid arthritis and especially systemic lupus erythematosus (SLE),

rheumatoid arthritis and especially systemic lupus erythematosus (SLE),

thyroidosis, graft versus host disease, scleroderma, diabetes mellitus,

and Graese, inflammantory diseases (other than septic shock),

neurodegenerative disorders, cereballar cortical degenerations, multiple

systems degenerations (e.g. Mencel, Dejerine-Thomas, Shi-Drager, and

Machado-Joseph), Refsum's disease, abetalipoprotemia, ataxia,

telangiectasia, mitochondrial multi-system disorder, amyotrophic lateral

sclerosis, infantile and juvenile spinal muscular atrophy, Alzheimer's

disease, Down's Syndrome in middle age, Diffuse Lewy body disease, Senile

Demontia of Lewy body type, Wernicke-Korsakoff syndrome, chronic

alcoholism, Creutzfeldt-Jakob disease, sub-acute sclerolising

panencephalitis, Hallerrorden-Spatz disease, dementia pugilistica,

leukemias, lymphomas, other TNF-secreting tumors or alcohol-induced The present PCR primer was used to construct a chimeric antibody for use in the method of the invention. The specification describes a method for treating tumour necrosis factor-alpha (TNR-alpha) mediated disease (not resulting from infection) using an anti-TNF chimeric antibody that inhibits the binding of TNF to monoclonal antibody cA2. The methods and chimeric antibodies are useful for treating and/or diagnosing TNF-alpha hepatitis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention provides antisense compounds targeted to human tumour necrosis factor receptor type 1 (TNFR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells or tissues. The antisense compounds specifically hybridize with one or more muclaic acids encoding TNFR1 modulating the function of nucleic acid molecules encoding TNFR1, ultimately modulating the amount of TNFR1 produced. The antisense compounds and method are useful as research
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tumour formation. Sequences AAZ48482-565 represent antisense oligos used for inhibition of the human TNFR1 mRNA

The invention provides antisense compounds targeted to human tumour necrosis factor receptor type 1 (TNFR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells or tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TNFR1 modulating the function of nucleic acid molecules encoding TNFR1, ultimately modulating the amount of TNFR1 produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tumour formation. Sequences AAZ48482-565 represent antisense oligos used for inhibition of the human TNFR1 mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention provides antisense compounds targeted to human tumour necrosis factor receptor type 1 (TNFR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tumour necrosis factor receptor type 1, TWFR1; antisense; infection; inflammation; tumour formation; TWFR1; anticancer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention provides antisense compounds targeted to human tumour necrosis factor receptor type 1 (TNFR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells or tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TNFR1 modulating the function of nucleic acid molecules encoding TNFR1, ultimately modulating the amount of TNFR1 produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tumour formation. Sequences AAZ48482-565 represent antisense oligos used for inhibition of the human TNFR1 mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             type 1; TNFR1; antisense; infection; INFR1; anticancer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention provides antisense compounds targeted to human tumour necrosis factor receptor type 1 (TNFR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells or tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TNFR1 modulating the function of nucleic acid molecules encoding TNFR1, ultimately modulating the amount of TNFR1 produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tumour formation. Sequences AAZ48482-565 represent antisense oligos used for inhibition of the human TNFR1 mRNA
or tissues. The antisense compounds specifically hybridize with one or more nucleic acid senceding TNRR1 medialating the function of nucleic acid molecules encoding TNRR1, ultimately medialating the amount of TNRR1 produced. The antisense compounds and method are useful as research reagents and disappositics, and in the treatment and prophlaxis of infection, inflammation or tumour formation. Sequences AAZ4842-565 represent antisense oligos used for inhibition of the human TNRR1 mRNA
                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tumour necrosis factor receptor type 1; TNFR1; antisense; infection; inflammation; tumour formation; TNFR1; anticancer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense inhibition of tumor necrosis factor type 1 expression for diagnosis, treatment and prevention of disease, particularly tumors

The invention provides antisense compounds targeted to human tumour necrosis factor receptor type 1 (TNFR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells or tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TNFR1 modulating the function of nucleic acid molecules encoding TNFR1, ultimately modulating the amount of TNFR1 produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tumour formation. Sequences AAZ48482-565 represent antisense oligos used for inhibition of the human TNFR1 mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

necrosis factor receptor type 1 (TWRE1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TWRE1 human cells or tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TWRE1 modulating the function of nucleic acid encoding TWRE1, ultimately modulating the amount of TWRE1 produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tunour formation. Sequences AAZ48482-565 represent antisense oligos used for inhibition of the human TWFRI mRNA
                                                                                                                                                             necrosis factor receptor type 1 (TURRI) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells or tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TWFR1 modulating the function of nucleic acid molecules encoding TNFR1, ultimately modulating the amount of TNFR1 produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tuneur formation. Sequences AAZ48482-565 represent antisense oligos used for inhibition of the human TNFR1 mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           type 1; TNFR1; antisense; infection; TNFR1; anticancer; ss.
                    Antisense inhibition of tumor necrosis factor type 1 expression for diagnosis, treatment and prevention of disease, particularly tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense inhibition of tumor necrosis factor type 1 expression for diagnosis, treatment and prevention of disease, particularly tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention provides antisense compounds targeted to human tumour

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention provides antisense compounds targeted to human tumour mecrosis factor receptor type 1 (TNRRI) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNRRI human cells or tissues. The antisense compounds specifically hybridize with one or tissues. The antisense compounds specifically hybridize with one or more nucleic acid sencoding TNRRI modulating the function of nucleic acid molecules encoding TNRRI, ultimately modulating the amount of TNRRI produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tumour formation. Sequences AAZ4862-565 represent antisense oligos used for inhibition of the human TNRRI mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention provides antisense compounds targeted to human tumour necrosis factor receptor type 1 (TNFR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells or tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TNFR1 modulating the function of nucleic acid molecules encoding TNFR1, ultimately modulating the amount of TNFR1 produced. The antisense compounds and method are useful as research
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tumour formation. Sequences AAZ48482-565 represent antisense oligos used for inhibition of the human TNFR1 mRNA

                                                                                               0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention provides antisense compounds targeted to human tumour necrosis factor receptor type 1 (TNFR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells or tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TNFR1 modulating the function of nucleic acid molecules encoding TNFR1, ultimately modulating the amount of TNFR1 produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tumour formation. Sequences AAZ48482-565 represent antisense oligos used for inhibition of the human TNFR1 mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention provides antisense compounds targeted to human tumour necrosis factor receptor type 1 (TNFR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells or tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TNFR1 modulating the function of nucleic acid molecules encoding TNFR1, ultimately modulating the amount of TNFR1 produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tumour formation. Sequences AAZA8482-565 represent antisense oligos used for inhibition of the human TNFR1 mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tumour necrosis factor receptor type 1; TNFR1; antisense; infection; inflammation; tumour formation; TNFR1; anticancer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense inhibition of tumor necrosis factor type 1 expression for diagnosis, treatment and prevention of disease, particularly tumors.
                                                                                                                                                Antisense inhibition of tumor necrosis factor type 1 expression for diagnosis, treatment and prevention of disease, particularly tumors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides antisense compounds targeted to human tumour necrosis factor receptor type 1 (TNFR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells or tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TNFR1 modulating the function of nucleic acid molecules encoding TNFR1, ultimately modulating the amount of TNFR1 produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tumour formation. Sequences AAZ48482-565 represent antisense oligos used for inhibition of the human TNFR1 mRNA

The invention provides antisense compounds targeted to human tumour necrosis factor receptor type 1 (TNFR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells or tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TNFR1 modulating the function of nucleic acid molecules encoding TNFR1, ultimately modulating the amount of TNFR1 produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tumour formation. Sequences AAZ48482-565 represent antisense oligos used for inhibition of the human TNFR1 mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Tumour necrosis factor receptor type 1; TNFR1; antisense; infection; inflammation; tumour formation; TNFR1; anticancer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention provides antisense compounds targeted to human tumour necrosis factor receptor (TUPRE) RNB. These antisense compounds can be used in a method of inhibiting the expression of TURPH human cells or tissues. The antisense compounds specifically hybridize with one or more mucleic acids encoding TURPH modulating the function of mucleic acid molecules encoding TURPH, ultimately modulating the amount of TURPH produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tumour formation. Sequences AAA48482-565 represent antisense oligos used for inhibition of the human TURPH mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention provides antisense compounds targeted to human tumour necrosis factor receptor type 1 (TNRR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells or tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TNFR1 modulating the function of mucleic acid molecules encoding TNFR1, ultimately modulating the amount of TNFR1 produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells or tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TNFR1 modulating the function of nucleic acid molecules encoding TNFR1, ultimately modulating the amount of TNFR1 produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tumour formation. Sequences AAZ48482-565 represent antisense oligos used for inhibition of the human TNFR1 mRNA

The invention provides antisense compounds targeted to human tumour necrosis factor receptor type 1 (TRFR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells or tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TNFR1 modulating the function of nucleic acid molecules encoding TNFR1 ultimately modulating the amount of TNFR1 produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of inflection, inflammation or tumour formation. Sequences AA246482.555
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          represent antisense oligos used for inhibition of the human TNFR1 mRNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention provides antisense compounds targeted to human tumour necrosis factor receptor type 1 (TNFR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells or tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TNFR1 modulating the function of nucleic acid produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tumour formation. Sequences AAX48480-565 represent antisense oligos used for inhibition of the human TNFR1 mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tumour necrosis factor receptor type 1; TNFR1; antisense; infection;

or tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TNFR1 modulating the function of nucleic acid molecules encoding TNFR1 ultimately modulating the amount of TNFR1 produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tumour formation. Sequences AAZ48482-565 represent antisense oligos used for inhibition of the human TNFR1 mRNA
The invention provides antisense compounds targeted to human tumour necrosis factor receptor type 1 (TNFR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells

Antisense inhibition of tumor necrosis factor type 1 expression for diagnosis, treatment and prevention of disease, particularly tumors.

Example 10; Col 25; 34pp; English.

The invention provides antisense compounds targeted to human tumour necrosis factor receptor type 1 (TNFR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells on tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TNFR1 modulating the function of nucleic acid molecules encoding TNFR1, ultimately modulating the amount of TNFR1 produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tumour formation. Sequences AAZ48482-565 represent antisense oligos used for inhibition of the human TNFR1 mRNA

PCR primers AAI65707-08 were used to amplify DNA encoding the extracellular domain of p55. The amplified fragment was used to produce p55 and Ig fusion proteins, in the course of the invention. The specification describes chimeric antibodies which bind to epitopes of human tumour necrosis factor (TNF)-alpha. Chimeric antibodies of the invention comprise at least part of a human immunoglobulin constant. The chimeric antibodies are useful in vivo diagnosis and therapy of TNF-alpha mediated pathologies and conditions. They can also neutralize human to be involved in e.g. pro-inflammatory actions, wasting associated with cancer and other diseases (cachexia), gram-negative sepsis and endotoxic parasitic or viral inflections, chronic inflammatory diseases, auto-immune parasitic or viral inflections, chronic inflammatory diseases, auto-immune

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    disease and rheumatoid arthritis). As inhibition or antagonism of TNF also decreases the expression of vascular endothelial growth factor (VEGF), the antibodies are also useful to treat VEGF-mediated diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0.8%; Score 18; DB 1; Length 18;

Unidentified US6284471-B1 The invention relates to chimeric anti-tumour necrosis factor (TNF)

Example 24; Col 82; 87pp; English.

```
The invention fractes to chimaric antibodies two light chains and two heavy chains, each of the chains comprises two light chains and two heavy chains, each of the chains comprises two light chains and two heavy chains, each of the chains comprising at least part of a human immunosatiobulin (Ig) constent region and at least part of a non-human Ig variable region, where the antibodies are capable of binding an epitope specific for human INF-alpha. Anti-INF antibodies or peptides may be used in research, therapeutic and diagnostic methods, specifically for diagnosing and/or treating animals or human having pathologies or conditions associated with the presence of a substance reactive with an enti-INF antibody. INF-related pathologies include acute and chronic immune disorders (e.g. bacterial, viral, fungal or parasitic infections), inflammatory diseases (e.g. ulcerative colitis, choured or semile chorea, disorders of the basal ganglia or cerebellar disorders), malignant pathologies (e.g. leukaemia, lymphomas), or alcoholinduced hepatitis. The anti-INF peptide or antibodies may also be used for immunoassays, which detect or quantitate TNF or anti-INF antibodies. The present sequence is a PCR primer used to amplify p55 TNF receptor heavy chain fusion DNA construct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DB 1; Length 18; 20;

Knight D, Ghrayeb J, (UYNY ) UNIV NEW YORK STATE. (CENZ ) CENTOCOR INC. (UYNY-) UNIV NEW YORK MEDICAL CENT. Daddona P, WPI; 2001-588928/66. Vilcek J, Le J,

New nucleic acid molecule encoding heavy or light chain variable regions of anti-tumor necrosis factor antibody, useful for alleviating symptoms or pathologies involving tumor necrosis factor.

Example 26; Col 92; 94pp; English.

The specification describes anti-tumour necrosis factor (TNF) antibodies. The anti-TNF antibody is useful for alleviating symptoms or pathologies involving TNF, such as bacterial, viral or parasitic infections (e.g. sepsis, cachexia, acquired immunodeficiency syndrome (AIDS) and septic shock), chronic inflammatory diseases (disseminated intravascular sphock), chronic inflammatory diseases (disseminated intravascular methods atherosclerosis, ulcerative colitis and chronic inflammatory bowel diseases, autolimmune diseases (e.g. rheumatoid arthritis, diabetes mellitus, graft versus host disease and Grave's disease), alcohol-induced hepatitis, malignancies and neurodegenerative diseases (e.g. multiple sclerosis, demyelinating diseases and acute transverse myelitis). The antibody is also useful in the treatment of vascular endothelial growth factor (VEGF) mediated diseases. PCR primers AMF78600-01 were used to amplify DNA encoding the p55 extracellular domain. p55 is a TNF receptor, and the amplified fragment was used to construct p55/Ig fusion proteins, in the course of the invention

```
The present invention relates to anti-tumour necrosis factor (TNF) antibodies, and anti-TNF peptides, which are specific for human tumour necrosis factor-alpha (TNFalpha). Methods of producing and using the anti-TNF antibodies and anti-TNF peptides are also disclosed. The anti-TNF antibodies, anti-TNF peptides and methods of the invention are useful for treating human neurodegenerative diseases (e.g. multiple sclerosis, acquired immunodeficiency syndrome (AIDS) dementia complex, a demyelinating disease, acute transverse myelitis, an extrapyramidal

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.

Example 10; Page 45; 121pp; English.

The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition

                                                                                                                                                                                                                                                                                                                                                                                         Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1. e.g. in liver disease (such as hepatitis, or liver injury) or a hyperpoliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for disquostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating to the TNFR1 of the invention
                                                                                                                                                                 Antisense compound; tumour necrosis factor receptor 1; liver disease; TNFR1; hepatitis; liver injury; hyperproliferative disorder; cancer;

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFRI), where the antisense compound inhibits expression of TNFRI. The antisense compound is useful for inhibiting the expression of TNFRI in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFRI, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFRI. The antisense compound is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating to the TMPRI of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            20-JUN-2002                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1 in calls or tissues. The antisense compound is useful for inhibiting the expression of treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymuleotide sequence represents a human oligonucleotide relating the manner of the formula of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibiting the expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as heparitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating
The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNRR), where the antisense compound inhibits expression of TNRRI. The antisense compound is useful for inhibiting the expression of treating an animal (preferably human) having a disease or condition associated with TNRR, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disease (such as hepatitis, or liver injury) or a hyperproliferative disease (such as cancer, by inhibiting the expression of TNRRI. The antisense compound is useful for disquostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a human oligonucleotide relating to the TNRRI of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antisense compound; tumour necrosis factor receptor 1; liver disease; TNFR1; hepatitis; liver injury; hyperproliferative disorder; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    INFRI expression modulation related antisense oligo SEQ ID No 139.

                                                                         ·,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNRR1), where the antisense compound inhibits expression of TNRR1. The antisense compound is useful for inhibiting the expression of TNRR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNRR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNRR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                            Antisense compound; tumour necrosis factor receptor 1; liver disease;

The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNRR1), where the antisense compound inhibits expression of TNRR1. The antisense compound is useful for inhibiting the expression of TNRR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNRR1, e.g. a liver disease (such as hepatitis, as a liver disease (such as hepatitis, or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNRR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a human oligomucleotide relating to the TNRR1 of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        tumor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNPR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.

The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibiting the expression of TNFR1. The antisense compound is useful for inhibiting the expression of treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a human oligonucleotide relating

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                 The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for dispositics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating to the TNFR1 of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 18 BP; 1 A; 5 C; 4 G; 8 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                        Example 18; Page 56; 121pp; English.

```
Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of
                                                                                                                                                                               Antisense compound; tumour necrosis factor receptor 1; liver disease; TNFR1; hepatitis; liver injury; hyperproliferative disorder; cancer; human; ds.
                                                                                                                                                         INFR1 expression modulation related antisense oligo SEQ ID No 116.

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating to the INFRI of the invention
                      TNFRI in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with INFRI, e.g. a liver diseases (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of INFRI. The antisense compound is useful for disponsities, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a human oligonucleotide relating to the INFRI of the invention
The antisense compound is useful for inhibiting the expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an antisense compound 8 to 30 nucleotides in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense compound; tumour necrosis factor receptor 1; liver disease; INFR1; hepatitis; liver injury; hyperproliferative disorder; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TNFRI expression modulation related antisense oligo SEQ ID No 118.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding timmour necrosis factor exceptor 1 (TNRR), where the antisense compound inhibits expression of TNRR. The antisense compound inhibiting the expression of TNRR, in cells or tissues. The antisense compound is useful for inhibiting the expression of treating an animal (preferably human) having a disease or condition associated with TNRR, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disease (such as cancer, by inhibiting the expression of TNRR. The antisense compound is useful for dismonstrics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating to the TNRR of the invention
                                                                                                                                                                                                                                                                              Antisense compound; tumour necrosis factor receptor 1; liver disease; TNFR1; hepatitis; liver injury; hyperproliferative disorder; cancer; human; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel antisense compound targeted to nucleic acid molecule encoding tumor
                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1. e.g. a liver disease (such as hepatitis, or liver injury) or a hyperpoliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating to the TNFR1 of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antisense compound; tumour necrosis factor receptor 1; liver disease; INFR1; hepatitis; liver injury; hyperproliferative disorder; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        INFR1 expression modulation related antisense oligo SEQ ID No 47.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              length targeted to nucleic and molecule encoding tumour necrosis actor receptor 1 (TWRN1), where the antisense compound inhibits expression of TWRN1. The antisense compound inhibiting the expression of TWRN1 in cells or tissues. The antisense compound is useful for treating an animal (preferably human) having a disease or condition associated with TWRN1. e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TWRN1. The antisense compound is useful for dispussions, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating to the TWRN1 of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 compound 8 to 30 nucleotides in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense compound; tumour necrosis factor receptor 1; liver disease;

                                                                                 The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TWRR1), where the antisense compound inhibitis expression of TWRR1. The antisense compound is useful for inhibiting the expression of treating a naimal (preferably human) having a disease or condition associated with TWRN1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disease (such as cancer, by inhibiting the expression of TWRR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a human oligonucleotide relating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting
necrosis factor receptor I (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense compound, tumour necrosis factor receptor 1, liver disease, TNFR1, hepatitis, liver injury; hyperproliferative disorder; cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or issues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disease compound is useful for the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a human oligonucleotide relating
the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating to the TNFR1 of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an antisense compound 8 to 30 nucleotides in
                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense compound; tumour necrosis factor receptor 1; liver disease;

The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor I (TNFR1), where the antisense compound inhibite expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferrably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating to the TNFR1 of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                 Antisense compound; tumour necrosis factor receptor 1; liver disease; INRR1; hepatitis; liver injury; hyperproliferative disorder; cancer; human; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TNFR1 expression modulation related antisense oligo SEQ ID No 135.
                                                                                                                                                                                                                                                                                   expression modulation related antisense oligo SEQ ID No 130.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0.8%; Score 18; DB 1; Length 18;

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxs and as research reagents and kits. This polymucleotide sequence represents a human oligonucleotide relating

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                               The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibities expression of TWFR1. The antisense compound is useful for inhibiting the expression of TWFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating to the TNFR1 of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          use compound; tumour necrosis factor receptor 1; liver disease; hepatitis; liver injury; hyperproliferative disorder; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             INFR1 expression modulation related antisense oligo SEQ ID No 50.

The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disease (such as cancer, by inhibiting the expression of TNRR1. The antisense compound is useful for disgnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligomucleotide relating to the TNFR1 of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibitis expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a human oligonucleotide relating to the TNFR1 of the invention
                                                                                                                                                                                                                                                                                                                                                         Antisense compound, tumour necrosis factor receptor 1, liver disease, TNFR1; hepatitis, liver injury; hyperproliferative disorder, cancer;

The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disease (such as hepatitis, or liver the expression of TNFR1, the antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating

to the TNFR1 of the invention

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                               The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibitis expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for reacting an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for disgnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFN1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense compound; tumour necrosis factor receptor 1; liver disease; TNFR1; hepatitis; liver injury; hyperproliferative disorder; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            INFR1 expression modulation related antisense oligo SEQ ID No 58.
                                                                                                                                                                                                                                                                                                                                                                                                                          0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0
                                                                                                                                                                                                                                                Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNPR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                           The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TWFR1), where the antisense compound inhibits expression of TWFR1. The antisense compound is useful for inhibiting the expression of treating an animal (preferably human) having a disease or condition associated with TWFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TWFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a human oligonucleotide relating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense compound; tumour necrosis factor receptor 1; liver disease; TNPR1; hepatitis; liver injury; hyperproliferative disorder; cancer; human; ds.

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having
treating an animal (preferably human) having a disease or condition associated with TWFRI, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TWFRI. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleoride sequence represents a human oligonucleoride relating to the INFRI of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating to the TNFR1 of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibiting the expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative discorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense compound, tumour necrosis factor receptor 1, liver disease, INFR1; hepatitis, liver injury; hyperproliferative disorder; cancer;

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNRR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating to the TNFR1 of the invention
                                                                                                                                                                                                                                        Antisense compound; tumour necrosis factor receptor 1; liver disease; INFR1; hepatitis; liver injury; hyperproliferative disorder; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                           INFR1 expression modulation related antisense oligo SEQ ID No 124.

ö The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNRR1), where the antisense compound inhibits expression of TNRR1. The antisense compound is useful for inhibiting the expression of TNRR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNRR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNRR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a human oligonucleotide relating Sequence 18 BP; 8 A; 1 C; 8 G; 1 T; 0 U; 0 Other; to the TNFR1 of the invention

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.

Example 10; Page 45; 121pp; English.

The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor exceptor 1 (TNFRI), where the artisense compound inhibits expression of TNFRI. The antisense compound is useful for inhibiting the expression of treating a nainal (preferably human) having a disease or condition associated with TNFRI, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFRI. The antisense compound is useful for disquencies, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating to the TNFRI of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNPR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     length targeted to nucleic acid molecule encoding tunour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibiting the expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibiting expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits.

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNPR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibiting sexpression of TNFR1. The antisense compound is useful for inhibiting the expression of treating an animal (preferably human) having a disease or condition associated with TNFR1. e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a human oligonucleotide relating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense compound; tumour necrosis factor receptor 1; liver disease; INFR1; hepatitis; liver injury; hyperproliferative disorder; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TNFR1 expression modulation related antisense oligo SEQ ID No 131.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibitis expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for tracting an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating to the TNFR1 of the invention
                                                                                                                                                                                                                         Antisense compound; tumour necrosis factor receptor 1; liver disease; INFR1; hepatitis; liver injury; hyperproliferative disorder; cancer; human; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense compound, tumour necrosis factor receptor 1; liver disease, INFR1; hepatitis; liver injury; hyperproliferative disorder; cancer;

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition treating an animal (preferably human) having a disease or condition associated with TNFR1. e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polyhudleotide sequence represents a human oligonucleotide relating

(ISIS-) ISIS PHARM INC

Dean NM; Zhang H, Cowsert LM,

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.

Example 18; Page 56; 121pp; English

The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor

receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a human oligonucleotide relating to the TNFR1 of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibities expression of TNFR1. The antisense compound is useful for inhibiting the expression of the antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1. e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymuleoride sequence represents a human oligonucleotide relating

The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for disponsities, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligomucleotide relating to the TNFR1 of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                             The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TMPR1), where the antisense compound inhibits expression of TWFR1. The antisense compound is useful for inhibiting the expression of treating an animal (preferably human) having a disease or condition associated with TMFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TMFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a human oligonucleotide relating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense compound; tumour necrosis factor receptor 1; liver disease;

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                           The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of traking an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disease (such as hepatitis, or liver the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a human oligonucleotide relating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibitis expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense compound; tumour necrosis factor receptor 1; liver disease; TNPR1; hepatitis; liver injury; hyperproliferative disorder; cancer; human; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
